PERSONAL DETAILS

Nationality: Filipino

Date of Birth: April 29, 2001

Place of Birth: Zamboanga City

WORK EXPERIENCE

Web Developer

CCS Const., Two-Seasons Hotel, Tumaga, Zamboanga City

January 2025 – April 2027

- **HTML** - Hypertext markup language (HTML) is the backbone of all websites. Some tools will allow you to create websites without writing HTML, but HTML takes your web development to the next level. Coding in HTML gives you more control over the content and understanding HTML will help you diagnose issues faster. You can also add SEO information directly in your HTML to help web crawlers read your page and increase your visibility
- **CSS** - The power of cascading style sheets (CSS) has grown. Developers used to primarily use CSS to define the color and layout of a website, but now it can handle animation and some interactive design. However, one of its most important features is responsive design.
- **JavaScript** - If HTML is the backbone of the website, JavaScript is the brain. Websites are no longer electronic versions of newsprint. Users expect interactivity—and interaction is the basis for many designs these days. To add this interactivity, you need a solid foundation in JavaScript.
- **SEO** - Creating a website is meaningless if no one can find it. As the number of websites grows, it has become more important to increase your website's visibility and readability to web crawlers, and you do this by using search engine optimization (SEO). At the very least, you need to know how web crawlers use the information to rank a site and what they can and cannot read. This will help you get the most out of adding metadata to your site and elements of the site that web crawlers cannot view.
